<tbody>
<tr>
<td>1</td>
<td>H</td>
<td>Hands-on Technology Experience</td>
<td>These courses provide the first brush-up for the incoming students to any stream. This is to be hand-on in-order to provide a feel of the stream but also build the basic foundations.</td>
</tr>
<tr>
<td>2</td>
<td>B</td>
<td>Technology Basics</td>
<td>These courses basically re-affirm what students have learnt as pre-requisites for a B. Tech program admission and may provide applied foundations in Mathematics and Sciences.</td>
</tr>
<tr>
<td>3</td>
<td>C</td>
<td>Technology Compulsory</td>
<td>These courses form the backbone of the technical program and encompass all its different sub-areas within the specific program.</td>
</tr>
<tr>
<td>4</td>
<td>E</td>
<td>Technology Electives</td>
<td>These courses form the backbone of the technical program and encompass all electives offered in the Institute.</td>
</tr>
<tr>
<td>5</td>
<td>P</td>
<td>Hands-on Technology Project</td>
<td>These courses help students to specialize in their areas of interest for future studies and research.</td>
</tr>
<tr>
<td>6</td>
<td>L</td>
<td>Life Skills</td>
<td>These courses will prepare students to be able to face the real world.</td>
</tr>
<tr>
<td>7</td>
<td>D</td>
<td>Introduction to Professional Work and Technology Industries</td>
<td>These courses will be taken in summer months after completing the first, second, and third year, respectively, for Industrial training. This 2 Semester or 10 course equivalents will provide students with rigorous industrial training and practice on the field. The work done by the students at the Industry will be in synergy with the supportive course work back at IIT Jodhpur. No grades and credits are assigned to this set of course equivalents.</td>

Pre-requisites of CSE courses:

- Discrete Math
- Linear Algebra
- Computer Programming
- Basic Electronics
- Digital Logic
- Design
- Comp. Organization
- Operating Systems
- Artificial Intelligence
- Database Systems
- Algorithm Design & Analysis
- Object-Oriented Data Structures
- Compiler Design
- Data Communication
- Probability, Stastics, Prob. Random Process
- Signals & Systems
- Computer Networks
I Semester

Course Title: System Exploration - Drawing  
Course No.: ME111
Focus Group: Mechanical Engineering  
Offered for: B.Tech.
Type: Hands-on Experience

Pre-requisite: To take effect from July 2014

Objectives
1. To inculcate how to express ideas of technical nature with a pragmatic intention.
2. To explore from the first idea and intuitive concepts to the final development and evaluation of the quality of a product.
3. Helping students understand the role of engineering graphics in a product design process.

Learning Outcomes
1. To distinguish between the different types of projections, indicate the dimensions and tolerance of technical products, read print, and change drawings according to specific requirements.
2. To visualize, and communicate product design using graphics.
3. To enable, optimize and digitize manufacturing of devices and components through graphic modeling.

Contents
1. Lettering Two dimensional geometrical constructions Conics Representation of three-dimensional objects Principles of projections Standard codes Projection of points.
2. Projection of straight lines Projection of planes - Projection of solids Auxiliary projections
3. Spatial geometry for design and analysis-Sections of solids and development of surfaces
5. Pictorial representation-Axonometric projection, Oblique projections and Perspective projections
7. Plan, Elevation and section of single storied residential (or) office building with flat/ with electrical wiring diagram
8. Fundamental practices of computer aided design and drafting
9. Introduction to AutoCAD/ Solid works Commands, Applied geometry using CAD, Technical Sketching, Editing techniques and commands in CAD
10. Orthographic projection; graphical analysis, Sectional views, Basic dimensioning methods, Primary and secondary auxiliary views in descriptive geometry
11. Definition of point, line, plane, Pictorial drawings, 3D drawings, Solid Modeling,

Reference Books
Course Title: Computer Programming  
Focus Group: Computer Science and Engineering  
Offered for: B.Tech.  
Pre-requisite: -  
Course No. CS111  
L-T-P [C] 3-1-3 [5]  
Type: Hands-on Experience  
To take effect from: July 2014

Objectives
1. To understand computer programming and its roles in problem solving  
2. To understand and develop well-structured programs using C language  
3. To learn the basic data structures through implementing in C language

Learning Outcomes
1. Problem solving through computer programming  
2. Familiarity of programming environment in Linux operating system  
3. Ability to use different memory allocation methods  
4. Ability to deal with different input/output methods  
5. Ability to use different data structures

Contents
1. Introduction to digital computers, Number systems - binary, octal, hexa, and conversion between the number systems, binary arithmetic  
2. Introduction to programming, Problem solving and expression of solution through flow chart and algorithm  
3. Parts of a program - primitive data types, variables, operators and their precedence, expressions, input/output, conditionals and branching, looping statements  
4. Functions, Storage classes - scope and life time, recursion  
5. Arrays, Pointers, User defined data types - structures, unions, Dynamic allocation, File Handling, Linear data structures List, Stack, and Queue, Time and space requirements

Laboratory
1. Understanding Linux working environment, Practicing Linux commands related to file system, file handling, editors, gcc compiler, gdb debugger;  
2. Basic data types, variables, input and output statements;  
3. Conditional and control structures;  
4. Arrays (one and two dimensional);  
5. Functions and Recursion;  
6. Structures, Unions and Enumeration;  
7. Pointers;  
8. File handling;  
9. Dynamic memory allocation;  
10. Linked Structures

Reference Books
Objective
To develop an understanding of the foundations of optics and electromagnetism.

Learning Outcome
The students will be able to relate theoretical concepts with problem solving approach in electrodynamics and optics.

Contents
1. Electromagnetism
3. Electrostatics: Coulomb's law, Gauss's theorem, electrostatic potential, Laplace's equation, conductors, capacitors and dielectrics.
7. Optics

Reference Books
2. Griffiths, D. J., (2005), Introduction to Electrodynamics, Prentice Hall of India
Course Title: Linear Algebra and Calculus  
Course No.: MA111

Focus Group: Mathematics  
Type: Basic

Offered for: B.Tech.  
Pre-requisite: -

To take effect from: July 2014

Objectives
1. To train the undergraduate students towards basic understanding of Mathematics.
2. To provide student with sufficient knowledge in calculus, which can be used by the students in their respective fields.
3. To develop a working knowledge of central ideas of Linear Algebra.

Learning Outcomes
1. Understanding of different structures and their properties like, Dependence, Basis and Dimension.
2. Linear transformations between two structures and its representation by Matrices.
3. Integration in higher dimension and Vector Calculus.

Contents
2. Sequences, Series, Power series, Limit, Continuity, Differentiability, chain Rule, Partial Derivatives, Gradient, Directional Derivative, Mean value theorems and applications; Linear Approximation, fundamental theorems of calculus, Newton and Picard method; Taylors theorem, Approximation by polynomials, Bisection method, false position method, fixed point method, Newton-Raphson method, secant method, Critical points, convexity, maxima and minima, Trapezoidal and Simpsons rule, Curve tracing, length, Area, Volume, Double and triple integrals, Differentiability of vector functions, arc length, Curvature, Continuity and Differentiability of vector functions, Vector Calculus, Greens Theorem, Gauss Theorem, Stokes Theorems.

Reference Books
Course Title: Discrete Mathematics
Course No.: CS112
Department: Computer Science and Engineering
Offered for: B. Tech. CSE
Pre-requisite: -

Objectives
1. To learn about proof techniques
2. To learn about combinatorics and graph theory
3. To learn about abstract algebra

Learning Outcomes
1. To be able to model the computer science problems using discrete mathematical structures

Contents
1. Mathematical Logic: Propositional Logic, First Order Logic, Proof techniques, Mathematical Induction
2. Set Theory and Algebra: Sets, Relations, Functions, Partial Orders, Lattice, Boolean Algebra, Groups and Rings, Error-correcting codes, Secret sharing
3. Combinatorics: Recurrence relations, common techniques for solving recursions, Permutations, Combinations, Counting, Polya Counting, Stirling numbers, Bell numbers, Combinatorial Sums
4. Graph Theory: Connectivity, Trees and its properties, Cut vertices & edges, Covering, Matching, Independent sets, Colouring, Planarity, Isomorphism
5. Discrete Probability: Linearity of expectation, Bayes Theorem

Reference Books
Course Title: English Language and Communication Skills
Course No.: HS111
Focus Group: Humanities and Social Sciences
Offered for: B.Tech. 1st year
Type: Life Skill
Pre-requisite: To take effect from July 2014

Objectives
1. To enable students to gain competence in English and to use language effectively in a number of contexts.
2. The course focuses on the four basic skills of language learning Reading, Writing, Listening and Speaking and trains the student to employ the above skills in both personal and professional settings.
3. Methodologies that are employed by the instructors include extensive use of audio, visual and print medium, exposes students from diverse backgrounds to both the creative and critical use of language.

Learning Outcomes
1. The course helps students to speak and write better English.
2. The course helps to integrate classroom learning into an everyday communicative activity.
3. Written work and interactive sessions facilitates the students to hone their communication skills in more ways than one.

Contents
1. English is a Crazy Language by Richard Lederer
2. The Snake by D. H. Lawrence
3. Kubla Khan by S. T. Coleridge
4. Short stories of Sherlock Holmes
5. Akeela and the Bee (film)
6. In Pursuit of Happyness (film)
7. Trumans Show (film)
8. Invictus (film)
9. Grammar exercises
10. Presentation Skills
11. Public Speaking
12. Group Discussion
13. Language Lab sessions

References
II Semester
Course Title: System Exploration - Workshop
Course No.: ME121
Focus Group: Mechanical Engineering
Offered for: B.Tech.
Pre-requisite: -

Focus Group: Mechanical Engineering
L-T-P[C] 3-0-3[4]
Type: Hands-on Experience
Pre-requisite: -
To take effect from: July 2014

Objectives
1. To develop basic knowledge of handling tools in different areas of manufacturing.
2. To provide a practical exposure to the vocational trades within basic practical activities associated with all branches of engineering.
3. To instill confidence to manufacture, assess quality and to perform maintenance or correction in product design.

Learning Outcomes
1. The importance of quality and design of the product with respect to material use, design dimensions and tolerances.
2. Understanding the activities and practical difficulties of skilled workman who ultimately are involved in producing all goods in any industry.
3. Understanding the various aspects of materials.

Contents
2. Casting: Principles of metal casting (Alloy solidification, homogenous and heterogeneous nucleation, cooling curve, concept of supercooling, grain growth, avrami equation), Patterns, Types of Patterns, Pattern Materials and pattern allowances, Types of Sands, Characteristics of molding sand, Types of cores, Chaplets and chills, their materials and functions, Casting Defects.
3. Geometric Tolerance design: Concept of limits fits and tolerances, hole based system, shaft based system, different types of fits
4. Metal Forming and Sheet metal operations: Basic Operations and their description (Forging, Rolling, Drawing, Extrusion, Bending, Spinning, Stretching, Embossing and Coining, Die and Punch operation in press work, Shearing, Piercing and blanking, Notching, Lancing.)
6. Joining Processes: Fundamentals of Electric arc welding (MMAW, SAW, GMAW, GTAW, PAW) Gas welding and cutting, Resistance welding and Thermit welding, Soldering, Brazing and Braze welding, Adhesive bonding, Mechanical fastening (Riveting,
Screwing, etc.). Plastic Processing: Plastics, their types and manufacturing properties, Introduction to Compression molding, Injection molding and Blow molding, Additives in Plastics. Modern Trends In Manufacturing: Introduction to numerical control (NC) and computerized numerical control (CNC) machines and Rapid Prototyping Techniques

Laboratory Work
Woodworking (Pattern making exercise), Preparation of aluminum casting, Machining exercise (turning operations), Welding exercise (Preparation of square butt joints, T-joints using arc welding), Sheet metal fabrication (Preparation of tray, funnel, etc.), Fitting exercise and heat treatment of steels, Demonstration on CNC Lathe, CNC Milling. Demonstration on Rapid Prototyping Technique and Electric Discharge Machine.

Reference Books
Course Title: *Basic Electronics Engineering*  
Course No.: EE121  
Focus Group: Electrical Engineering  
Offered for: B.Tech.  
Pre-requisite:  
Type: Hands-on Experience  
To take effect from: July 2014

**Objectives**
1. To introduce different components used in electronic circuits and explain their terminal characteristics
2. To teach various methods of electronic circuit analysis and design

**Learning Outcomes**
1. Ability to do time-domain analysis of electronic circuits for various branch currents and node voltages
2. Ability to appreciate the use of discrete components in designing application specific circuits

**Contents**
1. *Components and Sources*: Passive components, Resistance, Inductance, Capacitance; lumped element model; series, parallel combinations; Kirchhoffs law: voltage, current, linearity, Voltage and current sources; non ideal sources; representation under assumption of linearity; controlled sources: VCVS, CCVS, VCCS, CCCS; concept of gain, transconductance, transimpedance.
2. *Basic Circuit and Transient Analysis*: Node and loop analysis; Choice of nodes and branches for efficient analysis. Superposition theorem; Thevenin's theorem; Norton's theorem, RL and RC Circuits, Sinusoidal Steady State Analysis, RLC circuits, Time domain response of RL and RC circuits, Two-port Networks and Transfer Function, Sinusoidal steady state response; phasor; impedance; transfer function of two port networks. Frequency response: concept; amplitude and phase response; Bode plots.
3. *Discrete components and Circuits*: Discrete electronic devices: Diode, zener diode, BJT (Bipolar junction transistor), LED, Photodiode, Phototransistor, varactor; characteristics and operation using equivalent circuits, Diode circuits; clipper, clamper circuits. DC power supply: rectifier- half wave, full wave (center tapped, bridge), zener regulated power supply, regulation, BJT biasing; CE-biasing circuits, operating point; large/small signal models of CE-BJT amplifier.
4. *Operational Amplifiers*: Basic model; virtual ground concept; inverting amplifier; non-inverting amplifier, Integrator; differentiator; Basic feedback theory; +ve and -ve feedback; concept of stability; oscillator. Waveform generator for Square wave, triangular wave, Wien bridge oscillator, Schmitt trigger; astable multivibrator, Introduction to active filters, 555 timer: description and data sheet.
5. *Logic gates and Applications*: Numbering system, OR, NOT, AND, NOR and NAND; universal gates; XOR and XNOR gate; Truth tables, Combinational circuits. Designing combinational circuits: SOP, POS form; K-map; Optimization, Multiplexer; Gate base implementation. Logic function representation using truth table, Sequential circuits, flip-flops, S-R flip-flop; JK master slave flip flop; D-flip flop,

**Laboratory**
Using Laboratory Instruments; Characterization of Passive Circuit Elements (R, L, C); Time
Response of RC and RL Circuits; Frequency Response of RC and RLC Circuits; Equivalent Circuits and Audio Signals; Diode Characteristics and DC Power Supply; Bipolar Junction Transistor (BJT) Circuits: Inverter and Common Emitter Amplifier; Operational Amplifiers; Basic Combinatorial Circuits; Any new circuit.

Reference Books
Objectives
1. To provide practice to apply knowledge in work, energy and momentum to study rigid body mechanics
2. To educate about the forces and inertia and its effect of motion of rigid bodies.

Learning Outcomes
1. To analyse forces and moments on static rigid body, moments on or between multiple static rigid bodies and internal forces or moment within them
2. To model practical structural problems using concepts of free body diagrams and equilibrium conditions

Contents
2. Kinematics of particles, Velocity and acceleration in terms of path variables, simple relative motion, motion of particle relative to a pair of translating axes Newtons laws of rectangular coordinates/rectilinear translation, cylindrical coordinate/Central force motion. Conservation of Mechanical Energy, Work-energy equations, Center of mass based Kinetic energy, Principle of virtual work. Impulse and Momentum relation of particles, Moment of momentum equations-single particle/system of particles Translation/Rotation of rigid bodies, Charles theorem, time derivative of vector for different references. Parallel axis theorems, Rotational Pure rotation of a body of revolution about its axis of revolution/combined with translation. Three dimensional rotation, moment of inertia tensor, relation between angular momentum and torque in three dimensions, Gyroscopic forces. Simple harmonic oscillator, phase and phase difference, phasor diagram, oscillator with constant friction/velocity dependent damping. Forced Oscillations, power adsorption, lightly damped oscillator Motion in non-inertial frames, centrifugal force, Coriolis force/acceleration, rate of change of vector in inertial and rotating frames.
3. Experiments: Vector Analysis with force table; Motion Studies Position Vs time, Velocity Vs Time; Measuring Acceleration due to gravity; Projectile launch; Centripetal motion of Pendulum; Dynamics Atwood Machine; Dynamics experiments with Friction; Sound Waves Frequency analysis.
Reference Books
Course Title: Complex Analysis and Differential Equations
Course No.: MA121
Focus Group: Mathematics
Offered for: B.Tech.
Pre-requisite: -
To take effect from: July 2014

Objectives
1. Understanding of fundamentals of complex analysis.
2. Understanding of fundamentals of differential equations.

Learning Outcomes
1. Techniques for differentiation and integration of complex valued functions.
2. Finding analytical and series solution for ordinary and partial differential equations.

Contents
1. Complex numbers, algebra of complex numbers, functions, continuous and analytic functions, Cauchy Riemann Equations, elementary functions, Integral of a complex function, Cauchy-Goursat theorem, Cauchy’s Integral formula, derivatives of analytic functions, Moreras Theorem, Liouville’s theorem, maximum modulus principle, Taylor series, singularity, types of singularities, Laurent series, Cauchy’s Residue Theorem, Jordan’s Lemma, Evaluation of Real integrals.

Reference Books
Course Title: Data Structures and Algorithms
Course No.: CS121
Department: Computer Science and Engineering
Offered for: B. Tech. CSE
Pre-requisite: CS111
To take effect from: July 2014

Objectives
1. To introduce algorithms analysis and design techniques
2. To understand algorithms of various data structures used for searching, sorting, indexing operation

Learning Outcomes
1. Ability in using the appropriate algorithm for searching, sorting, indexing operations
2. Designing of new algorithms
3. Analyzing complexity issues of algorithms

Contents
1. Algorithm analysis and complexity: Big/little -Oh, Omega, Theta notation, Recurrence equations
2. Sorting algorithms: Bubble, Selection, Insertion, Shell, Quick, Merge sorting algorithms, Internal and external, stable sorting techniques
3. Abstract data types: List, Stack, Queue, Circular Queues, Tree, Binary trees and Tree traversal and applications of various ADTs
4. Search trees: Binary search trees, Balanced search trees, AVL trees, Splay trees, B-Trees
5. Heaps: Heap order property and min/max heaps; Sets: and basic operations on Sets
6. Hashing: Hash tables, hash function, Hash table ADT and operations, Open and closed hashing, External and internal hashing, Closed hashing - Collision resolving methods, Rehashing, External hashing algorithms - extendible hashing
7. Graph algorithms: Definitions, Representation, Traversal, Shortest-path algorithms, Minimum spanning tree algorithm, Topological sorting
8. Algorithm design techniques: Divide and Conquer, Greedy, Dynamic Programming technique

Laboratory
1. Implementation of data structures using object oriented programming language
2. Verifying run time performance and asymptotic behavior of various data structures and related algorithms
3. Live applications of data structures

Reference Books
2. Weiss, M. A. (2007), Data Structures and Algorithm Analysis in C++, Addison-Wesley
Objective
1. Basic Electrical Engineering is designed to provide the basic concepts of electrical power circuits and system, and operational principles of dc and ac machines and their applications.

Learning Outcome
1. This course provides the basic knowledge of electrical power system. By the end of the course, the student must be able to analyse any ac circuit and familiar with the operation and applications of various ac and dc machines.

Contents
1. Introduction to Power Systems, Distinction between Generation, Transmission and Distribution, Power Grid and its advantages, Smart Grid Concept.
2. Introduction to alternating electrical quantities, Vector, Complex and Phasor diagrams, Polar Notations.
4. Star-Delta conversion, Three-phase ac circuit analyses, Measurement of three phase power, Neutral Grounding, Grounding for Protection in single phase ac.
7. DC Machines, Types, Torque-Speed characteristics, Universal Motors, their applications and limitations.
8. Induction Motors- Single and Three-phase, their Starting and Speed Control methods and their applications, Doubly Excited Induction Generators (DEIS).
10. Introduction to, Variable Reluctance Machines (VRMs), Brushless dc Motors Permanent Magnet ac Motors, Stepper and Linear Induction Motors.

Reference Books
2. Sukhija, M. S., Nagsarkar, T. K., (2012), Basic Electrical and Electronics Engineering, Oxford University Press
Course Title: Digital Logic and Design
Course No.: EE222
Focus Group: Computer Science & Engineering
Offered for: B.Tech.
Pre-requisite: EE121

Objectives
1. To introduce the basic concepts of digital system and the use of Boolean algebra in logic analysis and design
2. Understand the principles and methodology of digital logic design at the gate and switch level, including both combinational and sequential logic elements.
3. To introduce basic tools of logic design and provide hands-on experience designing digital circuits and components through simple logic circuits to hardware description language and interface programming in C.
4. To appreciate the uses and capabilities of a modern FPGA platform

Learning Outcomes
Students will be able to
1. Apply Boolean algebra and other techniques to express and simplify logic expressions.
2. Analyze and design combinational and sequential digital systems.
3. Use different techniques among them a hardware description language and a programming language, to design digital systems.

Contents
1. Number system: binary numbers, 1s and 2s complement, arithmetic operations in integer and floating point systems; ASCII, binary and gray codes;
2. Boolean algebra: Boolean Equations, Minimization of Boolean functions; Designing combinational Circuits using gates and/or Multiplexers
3. Combinational circuit: Adder, decoder, multiplexers, code converters (binary, gray and BCD);
4. Iterative circuits (spatial iteration) and its relationship with temporal iteration
5. Sequential circuit: Latches and flip-flops, counters, shift register;
6. Finite state machine; representation and synthesis
7. Hardware Description Languages: Combinational Logic, Structural Modeling, Sequential Logic, More Combinational Logic, Finite State Machines, Parameterized Modules, Test benches
8. ADC and DAC: Sample and hold circuits, ADCs, DACs.
9. Memories: semiconductor memories, PALs, PLAs and FPGAs; Pipelining and timing issues, PROMs (DRAMs, Flash etc.);
10. Small algorithm synthesis: Data and control parts

Laboratory
1. Design AND, OR and EX_ OR gates using Nand gates and verify them.
   a. Design a BCD to 6-3-1-1 Code converter and verify.
   b. Design a 6-3-1-1 to Gray Code converter and verify.
2. Design a 4 - Bit comparator using logic gates.
3. Design a priority multiplexer for 8 Devices. Each device has one data output line, a request output line, and an acknowledgement input line. The data from the highest
priority device has to be made available at the output of the priority multiplexer, and an acknowledgement has to be sent to that device. The circuit may be designed using priority encoder, multiplexer and decoder.

5. Design a Counter which counts the following arbitrary sequence: 0101, 0001, 1000, 1001, 1010, 0000, 0101... (First starting from FSM)
6. Design a Pseudo-random bit generator and check its performance
7. Write and verify a VHDL code for simulation of an 8-bit signed integer multiplier using carry save adders.
8. Design and implement a small algorithm (example: GCD computation)

Reference Books
Course Title: Chemistry
Course No.: CY211
Focus Group: Chemistry
Type: Basic
Offered for: B.Tech.
Pre-requisite: -
To take effect from: July 20, 2014

Objectives
1. This is a course designed to relate the fundamental principles of chemistry with practical problems encountered for engineers. Emphasis will be placed on problem-solving.
2. This course will enable the students to scientific logics of various laboratory safeties and fire in different type of labs. Laboratory will correlate with lecture material.

Learning Outcomes
1. Understanding the behavior of matter and materials using fundamental knowledge of their nature
2. Predict potential complications from combining various chemicals or metals in an engineering setting.
3. Maintaining safe laboratory practice while working in lab and otherwise.
4. Keep notebooks of laboratory experiments and be able to evaluate results based on their own notes.

Contents
1. Thermodynamics of Chemical Processes: Concept of entropy, Chemical potential, Equilibrium conditions for closed systems, Phase and reaction equilibria, Maxwell relations, Real gas and real solution.
2. Electrochemical Systems: Electrochemical cells and EMF, Applications of EMF measurements: Steady state approximation, Chain reactions, photochemical kinetics
4. Coordination Chemistry: Coordination numbers, Chelate effect, Coordination complexes and application.
5. Bio-inorganic chemistry: Metal ions in Biological systems, environmental aspects of Metals, NOx, CO, CO2
7. Stereochemistry of Carbon Compounds: Selected Organic Compounds: Natural products and Biomolecules
8. Organic material: polymers, synthetic and natural polymers and their applications

Laboratory
1. Aldol condensation (preparation of tetra phenyl cyclo pentadienone)
2. Preparation of complex salt of (Co (en) 6) Cl3
3. Preparation of double salt crystal of ammonium copper (II) sulphate hexahydrate
4. Saponification (Preparation of soap)
5. Preparation of Nylon-6, 6
6. To prepare hexamine coblt (III) Chloride (Co (NH3) 6)Cl3
7. Determination of dissolved oxygen in a water by Winklers method
8. To use Fourier transform infrared (F. T. I. R) spectroscopy in combination with A. T. R.
(Attenuated total reflectance) technique for bio analysis of caffeine in tea & coffee and also get IR spectrum of Aldol product and analysis of the spectrum.

9. To plot the excitation and emission spectrum of curcumin in solvents respectively ethanol and hexane and find stokes shift by using fluorescence spectroscopy.

10. To determine the heat capacity, glass transition temperature and the change in heat capacity for glass transition temperature for polystyrene by using Differential scanning calorimetry (DSC).

11. To understand the theory and working principle of cyclic voltammetry and to perform CV on ferricyanide solution and to know its electrical properties for example Ep, Ip and diffuse rate etc.

Reference Books
Object-Oriented Analysis and Design

Department: Computer Science and Engineering
Course No.: CS212
Offered for: B. Tech. CSE
Pre-requisite: CS111

Objectives
1. To understand the Object-based view of Systems
2. To develop robust object-based models for Systems
3. To inculcate necessary skills to handle complexity in software design

Learning Outcomes
1. Ability to analyze and model software specifications.
2. Ability to abstract object-based views for generic software systems.
3. Ability to deliver robust software components.

Contents
1. Introduction to OOAD: Basic notion of objects, Multiple Views of Objects, Contrasting with Procedural Computation – Client-Server/Message Passing, Principles of OOAD – Abstraction Hierarchy, Decomposition Hierarchy, Member-Of
6. Handling the Breakdown of Design-by-Contract: Exceptions to handle Contract violations, Exception handling in C, Exception handling in C++, Exception Classes in C++ Standard Library
7. Templates: Function Templates, Class Templates, Partial Template Instantiation, Generic, Programming through Template Meta-Programming

Laboratory
1. Java Programming for 2 simple applications
2. C++ Programming for Building Special Types (like Complex, Fractions, Polynomial, Matrix)– robust with failure (exceptions) and generic with type (like Polynomial of Complex should be allowed)
3. C++ Programming for Data Structure (Stack, Tree, or Graph) – robust with failure (exceptions) and generic with type (for example, Stack of Complex should be allowed)
4. Simple Design Patterns – Singleton, Iterators & Visitors in multiple hierarchy domains like automobiles

Reference Books
2. Miles, R. & Hamilton, K., (2006), Learning UML 2.0 – A Pragmatic Introduction to UML. O'Reilly Media
5. Sutter, H., (1999), Exceptional C++ & More Exceptional C++, Addison-Wesley
7. Alexandrescu, A., (2001), Modern C++ Design, Addison-Wesley
Course Title: Signals and Systems
Course No.: EE213
Focus Group: Electrical Engineering
Offered for: B.Tech.
Pre-requisite: -
Type: Compulsory
To take effect from: July 2014

Objectives
1. Fundamentals of continuous-time and discrete-time linear systems and their dynamical properties.
2. Understanding of frequency domain transform analysis of LTI systems.
3. State space analysis of I/O systems.
4. Design and analysis of various Filters.

Learning Outcomes
1. Understanding the practical relevance of system properties such as linearity, time invariance, stability and causality and use of mathematical transform methods to analyze LTI systems.
2. Analyzing continuous time systems using Fourier transform as well as Laplace transform and discrete time systems using Discrete Time Fourier Transform as well as Z-transform.
3. Fundamentals of filter concepts

Contents
1. Continuous and discrete time signals: Classification of signals, Signal Energy, Signal Power, Useful operation on signals and signal models, even and odd functions
2. Frequency Domain Representation: Fourier series, Fourier, Laplace and Z transform techniques, DTFT, DFT.
4. LTI systems: Classification of Systems, I/O description, impulse response and system functions, pole/zero plots, state space description, block diagram representation, Time and Frequency domain analysis, FIR and IIR Systems
5. Analog Filters: Low-pass, high-pass, band-pass and band-stop (band-reject) filters. Filter characteristics, filter circuit transfer function, and its poles and zeros. First order, second order active and passive filters and building blocks to construct higher order filters.

Reference Books
IV Semester

Course Title: Probability, Statistics and Random Processes  
Course No.: MA221  
Focus Group: Mathematics  
Offered for: B.Tech.  
Pre-requisite: -  
To take effect from: July 2014

Objectives
1. To equip the students with the broad perspective of probability theory.
2. To develop the understanding of various discrete and continuous distributions along with their properties.
3. To understand and differentiate among various statistical and random processes techniques.

Learning Outcomes
1. Ability to analyze and differentiate between deterministic and random environment.
2. Ability to select an appropriate distribution for analyzing data specific to an experiment.
3. Understanding of various statistical and random processes techniques which can be applied to data arising in various applications.

Contents
1. Introduction to Probability, axioms of probability, Conditional probability, Bayes Theorem, Random Variable, Discrete and Continuous random variables, Distribution Function and Probability Density (Mass) Function, Expectation and Moments of random variables, Moment Generation Function and Characteristic Function, Jointly distributed random variable, Transformation of Random Variables, Special Discrete distributions, Special Continuous distributions, Chebyshevs inequality, Law of large numbers, Central Limit Theorem
2. Regression Analysis, Parameter Estimation, Maximum Likelihood Estimator, Confidence Interval, Hypothesis Testing, Goodness of Fit test

Reference Books
1. Ross, S. M., (2012), Introduction to probability and statistics for engineers and scientists, Elsevier
Course Title: Computer Organization and Architecture  
Course No.: CS221  
Department: Computer Science and Engineering  
Offered for: B. Tech. CSE  
Pre-requisite: CS211  
Type: Compulsory  
To take effect from: July 2015

Objectives
1. To understand aspects of computer architecture and program performance  
2. To provide essential understanding of different subsystems of modern computer system and design aspects these subsystems  
3. To understand the stages in instruction life cycle  
4. To understand performance enhancement methods in instruction execution

Learning Outcomes
1. Ability to identify the basic components and design of a computer, including CPU, memories, and input/output units  
2. Ability to identify the issues involved in the instruction execution and various stages of instruction life stage  
3. Ability to identify the issues related to performance improvement  
4. Ability to distinguish performance tradeoff between different memory units and instruction sets

Contents
1. Basic functional blocks of a computer: CPU, memory, input-output subsystems, control unit. Instruction set architecture of a CPU – registers, instruction execution cycle, RTL interpretation of instructions, addressing modes, instruction set, Instruction set architecture CISC, RISC, Case study – instruction sets of common CPUs  
2. CPU Subblock, Datapath – ALU, registers, CPU buses; Control unit design: hardwired and micro-programmed design approaches  
3. Memory system design: semiconductor memory technologies, memory organization, cache memory hierarchy  
4. Peripheral devices and their characteristics: Input-output subsystems, I/O transfers – program controlled, interrupt driven and DMA, Secondary storage devices  
5. Privileged and non-privileged instructions, software interrupts and exceptions, Programs and processes – role of interrupts in process state transitions  
6. Pipelining: Basic concepts of pipelining, throughput and speedup, pipeline hazards  
7. Introduction to superscalar processors architecture: parallel pipelines, out of order execution, branch prediction  
8. Introduction multithreaded processors architecture and multicore processors architecture  
   (Introduce use of architecture simulation, debugging as well as performance analysis tools.)

Reference Books
Course Title  Theory of Computation
Department  Computer Science and Engineering
Course No. CS222
Offered for B. Tech. CSE
Pre-requisite CS112

Objectives
1. To learn about languages, grammars, and computation models
2. To learn about computability
3. To learn about computational complexity

Learning Outcomes
1. To be able to distinguish between computable and un-computable problems
2. To be able to distinguish between tractable and intractable problems

Contents
1. *Finite Automata and Regular Languages*: DFA, NFA, Regular expressions, Equivalence of DFA and NFA, Closure properties of Regular Languages, Regular Pumping lemma, Myhill-Nerode theorem and State minimization
2. *Push-Down Automata and Context Free Languages*: Designing CFGs, Ambiguity, Chomsky Normal Form, Closure properties, CF Pumping Lemma
3. *Computability*: Turing Machines, Church-Turing Thesis, Variants of Turing machines, non-determinism, enumerators, Decidability, Halting problem, Reducibility, Rice's theorem, Undecidability, Godel's incompleteness theorem
4. *Computational Complexity*: The classes P and NP, Boolean circuits, NP Completeness (example problems: SAT)

Reference Books
Objectives
1. To understand the best practices in software engineering.
2. To develop the necessary skills to handle software projects in a principled way.

Learning Outcomes
1. Ability to analyze and specify software requirements.
2. Ability to apply software engineering principles and techniques to develop large-scale software systems.
3. Ability to plan and work effectively in a team.

Contents
1. Introduction: Problem of software development, problem of scale, basic process approach, etc.
2. Software Process Models: concept of processes, process specification, process models & utilities
3. Advanced Object-based Modeling – Unified Modified Language
   a. Structural Diagrams: Profile, Component, Package, Deployment, and Composite Structure
   b. Behavioral Diagrams: Timing, Communication, and Interaction Overview
4. Requirement analysis and specification: the basic problem, the sub-phases in the phase, analysis techniques (structured analysis), specification, validation, function point analysis, coding requirement specification in UML
5. Design principles and structured design methodology: partitioning, top-down and bottom-up, step-wise refinement, coupling and cohesion, design on UML
6. Coding: style, structured programming, verification concepts
7. Testing: testing purpose, levels of testing, black box testing, white box testing, different test case generation approaches, test planning, test scenarios, regression testing
8. Project planning: effort, schedule, quality, project monitoring, and Configuration Management
9. Agile Software Development: The agile philosophy, agile process models, agile project management, SCRUM, SPRINT.
10. Test-Driven Development: Test case design, workflow, refinements

Laboratory
1. Software Requirements Specification: Prepare SRS for the given systems like Leave Management System, Assignment Management System, Story Management System (Newspaper House) etc. (Every student works with her / his partner with one specified system – chosen from a set of 20 systems)
2. HDL and LLD of the Systems under Development
3. Coding and implementation of the System
4. Test Modeling with UML – Test Plan, Test Scenarios, Regression Test
5. Deployment and Customer Feedback
6. Requirements Migration and Version Management

**Reference Books**
Course Title: B. Tech. Project
Department: Computer Science and Engineering
Course No: CS299
Offered for: 4th to 8th Semester
Pre-requisite

Objectives
1. To gain hands on experience on innovative technology project
2. To prepare the students to solve/work on the real world/practical/theoretical problems involving issues in computer science and engineering

Learning Outcomes
1. Ability to design and model a system
2. Ability to plan and execute well defined objective
3. Ability to work in team at component level and system level
4. Ability to troubleshoot
5. Ability to reuse- or integrate with- existing components
6. Ability to derive performance metrics and assess quantitatively the performance of system
7. Ability to report and present the findings in standard formats
V Semester

Objectives
1. To understand basic components of a data communication system, the transmission and reception techniques for communications, and the channel impairments and their influence on data transmission
2. To understand different types of channel, medium, resource sharing and access techniques
3. To understand issues of flow control and error control
4. To introduction principles of packet switching techniques and data networking

Learning Outcomes
1. Ability to identify basic components of data communication system
2. Ability to distinguish various data transmission and modulation techniques
3. Ability to analyse the impact of various channel impairments on data transmission
4. Ability to identify different data networks and the networking hardware

Contents
1. Communication problem and system models, components of communication systems, communication channels and their characteristics, mathematical models for communication channels, multiple access techniques, link budget analysis
2. Representation of deterministic and stochastic signals, random noise characterization in communication systems, signal-to-noise ratio, characterization of communication signals and systems: signal space representations, representation of analog and digitally modulated signals, spectral characteristics of modulated signals
3. Optimal receivers: Receivers for signals corrupted by AWGN, Error performance Analysis of receivers for memory-less modulation, optimal receivers for modulation methods with memory, OFDM, MIMO
5. Channel coding: Linear block codes, CRC, convolution codes, Viterbi decoding algorithm
6. Principles of switching; Local area networks: Ethernet, Fast Ethernet, Token Ring, Introduction to Gigabit Ethernet and Wireless LANs; Hubs, bridges and switches

Reference Books
Course Title: Compiler Design
Department: Computer Science and Engineering
Offered for: B. Tech. CSE
Pre-requisite: CS222
Course No.: CS312
L-T-P [C] 3-0-3 [4]
Type: Compulsory
To take effect from: July 2015

Objectives
1. To learn about different types of grammars used in Compilers
2. To learn about different phases of a Compiler

Learning Outcomes
1. Ability to use Lex for designing lexical analyzers
2. Ability to use Yacc for designing syntax Analyzers
3. Ability to design parsing tables from grammars

Contents
1. Introduction: Structure of a Compiler, Different types of Programming Languages: Imperative Languages, Block Structured Languages, Functional Programming Languages, Declarative Programming Languages, Object-oriented Programming Languages
2. Lexical Analysis: Input Buffering, Token Specification, Token Recognition, Lex
4. Syntax Directed Translation: Syntax Directed Definition, Syntax Directed Translation, L-attributed SDD
5. Run Time Environments: Storage Organization, Stack Allocation, Heap Management, Garbage Collection
7. Code Generation: Programs, Instructions, Addresses, Basic Blocks and Flow Graphs, Optimization of Basic Blocks, Register Allocation and Assignment
8. Machine Independent Optimizations: Sources of Optimization, Data Flow Analysis

Laboratory
1. Understanding x86 assembly language
2. Designing a Lexical Analyzer in C
3. Designing a Lexical Analyzer using Lex
4. Using Yacc to design an Intermediate Code Generator
5. Target code generation to x86 assembly language

Reference Books
**Course Title**: Operating Systems

**Department**: Computer Science and Engineering

**Course No.**: CS313

**Offered for**: B. Tech. CSE

**Pre-requisite**: CS111, CS221

**Type**: Compulsory

**To take effect from**: July 2014

### Objectives
1. To learn about design principles of operating systems
2. To do a case study of Operating System

### Learning Outcomes
1. Ability to modify and compile OS
2. Ability to solve synchronization problems in Operating Systems

### Contents
2. Processes Management: Process, Threads, CPU Scheduling
3. Process Coordination: Mutual Exclusion, Mutex Implementation, Semaphores, Monitors and condition variables, Deadlocks
4. Memory Management: Swapping, Paging, Segmentation, Virtual Memory, Demand Paging, Page Replacement Algorithms

### Laboratory
1. Designing a shell in Minix 3
2. Multithreaded programming using pthread
3. Solving the Sleeping-Barber problem
4. Modification of scheduling algorithm in Minix 3
5. Solving the Producer-Consumer problem over a network
6. Finding text, data, and stack segments of a process in Minix 3
7. Implementation of page replacement algorithms
8. Changing file attributes in Minix 3
9. Implementing an encrypted file system in Minix 3
10. Implementing symbolic links in Minix 3

### Reference Books
Course Title: Algorithm Design and Analysis
Course No.: CS314
Department: Computer Science and Engineering
Offered for: B. Tech.
Pre-requisite: CS112, CS121, CS222
To take effect from: July 2015

Objectives
1. To learn about various algorithm design techniques
2. To learn about advanced data structures
3. To learn about complexity analysis of algorithms

Learning Outcomes
1. Ability to apply randomization to design algorithms
2. Ability to solve intractable problems using approximation algorithms
3. To model optimization problems as Linear Program

Contents
1. Advanced Data Structures: Amortized analysis, Binomial heaps, Fibonacci heaps, Splay Trees etc.
2. Dynamic programming
3. Lower bounds and NP-completeness
4. Linear-programming: Definitions of canonical and standard forms, feasibility and optimization, Structure of Optima, Duality Theory, Duality Applications, Simplex Algorithm
5. Approximation Algorithms: Relative Approximations, PAS and FPAS Scheduling, etc.
6. Randomized algorithms: Karger’s min-cut, Balls and Bins model and its applications, Hashing, Bloom filters, Quick sort, Quick select, Markov, Chebyshev and Chernoff and their applications in finding upper bounds on algorithm errors
7. String matching algorithms
8. Network flows and matching

Type: Compulsory
To take effect from: July 2014

Objectives
1. To gain hands on experience on innovative technology project
2. To prepare the students to solve/work on the real world/practical/theoretical problems involving issues in computer science and engineering

Learning Outcomes
1. Ability to design and model a system
2. Ability to plan and execute well defined objective
3. Ability to work in team at component level and system level
4. Ability to troubleshoot
5. Ability to reuse or integrate with existing components
6. Ability to derive performance metrics and assess quantitatively the performance of system
7. Ability to report and present the findings in standard formats
VI Semester

Course Title: Computer Networks
Course No.: CS321
Department: Computer Science and Engineering
Offered for: B. Tech. CSE
Pre-requisite: CS311

Objectives
1. To understand the organization of computer networks, factors influencing on the performance of computer networks, and the reasons for having variety of different types of networks
2. To understand the Internet structure, various protocols of the Internet and how these protocols address the standard problems of networking and the Internet
3. Hands-on experience on networking fundamentals through practical sessions

Learning Outcomes
1. Familiarity with the essential protocols of computer networks and their operations
2. Design and implementation of computer networks
3. Identifying various design parameters such as latency, bandwidth, error rate, throughput, and their influence on node/link utilization and performance

Contents
1. Layer approach, Packet switching techniques, Performance metrics delay, loss, throughput, bandwidth delay product, latency
2. Applications: Network programming, socket abstraction, client server architecture, naming and addressing, electronic mail, file transfer, remote login, world wide web, domain name service, journey of a packet
3. Transport Layer: Transmission Control Protocol flow control, error control, congestion control, header, services, connection management, timers, congestion control; User Datagram Protocol
4. Network Layer: Internetworking, Tunneling, Encapsulation, Fragmentation, Internet Protocol and its operation, etc., Routing algorithms distance vector and link state algorithm and Routing protocols, the related protocols, ICMP, ARP, RARP, DHCP, IPv6, RIP, OSPF
5. Advanced Internetworking, Multicast routing, Queuing disciplines and buffer management techniques
6. Data link layer: framing, medium access mechanism
7. Network security: Public key and private key cryptography, digital signature, firewalls
8. Advanced topics, SDN and Open flow Architectures

Laboratory
1. Networking hardware
   a. Understanding cables, switches, routers
   b. Setting up switching network
   c. Setting up subnets and routing across the subnets
2. Socket programming - Development of client-server application using sockets (possible examples, file transfer, peer-peer applications, chat, network monitor etc.)
3. Networking commands - ifconfig, route, arp, arping, ping, netstat. tcpdump, host, nslookup, dig, ftp, scp, ssh, finger, dhclient, dhcrelay etc.

4. Protocol analyzer - closely looking at protocols (HTTP, TCP, UDP, ICMP, 802.3, DHCP, DNS etc.) headers and analyzing the interactions between client and server of different applications

5. QualNet simulator/Packet Tracer
   a. Implementation of ARQs - Stop-and-wait, Sliding Window goback N etc.
   b. Verifying operations of routing protocols
   c. Verifying influence of congestion on end users performance
   d. Verifying basic congestion control algorithms Reno, New Reno, Cubic
   e. Verifying router buffer size on end users performance

Reference Books
Course Title: Database Systems
Course No.: CS322
Department: Computer Science and Engineering
Offered for: B. Tech. CSE
Pre-requisite: CS313
Type: Compulsory
To take effect from: July 2014

Objectives
1. To understand the concepts of database management system and its applications, data modeling, database design, and query languages.
2. To understand different files structures, transaction management, concurrency control, database recovery, query processing and optimization.

Learning Outcomes
1. Ability to apply different data modeling methods in requirement analysis, design, and implementation of database system.
2. Ability to apply the normal forms for efficient designing of relational database
3. Ability to use appropriate storage and access structures
4. Ability to use techniques for transaction management, concurrency control, and recovery
5. Ability to analyze complexity issues of query execution

Contents
2. Relational Data Model and Relational Database Constraints, Relational Database Design by ER-and EER-to-Relational Mapping, Relational Algebra and Relational Calculus, SQL: Schema Definition, Constraints, Queries, and Views
3. Functional Dependencies and Normalization, Algorithms for Query processing and optimization
4. Disk Storage, Basic File Structures, and Hashing, Indexing Structures for Files
5. Transaction Processing Concepts and Theory, Concurrency Control Techniques and Protocols, Database Recovery Techniques
6. Glimpses – Distributed Database, Handling Unstructured Data, Big Data, no SQL

Reference Books
Objectives
1. To provide the foundations for AI problem solving techniques and knowledge representation formalisms

Learning Outcomes
1. Ability to identify and formulate appropriate AI methods for solving a problem
2. Ability to implement AI algorithms
3. Ability to compare different AI algorithms in terms of design issues, computational complexity, and assumptions

Contents
1. Un-informed search strategies: Breadth first search, Depth-first search, Depth-limited search, Iterative deepening depth-first search, bidirectional search
2. Informed search and exploration: Greedy best-first search, A* search, Memory-bounded heuristic search
3. Local search algorithms and Optimization: Hill climbing, Simulated Annealing, Local beam search, Genetic Algorithms
4. Constraint Satisfaction Problems: Backtracking search for CSPs, Local search for CSPs
5. Adversarial Search: Optimal Decision in Games, The minimax algorithm, Alpha-Beta pruning
6. Knowledge and Reasoning: Propositional Logic, Reasoning Patterns in propositional logic; First order logic: syntax, semantics, Inference in First order logic, unification and lifting, backward chaining, resolution
7. Knowledge Representation: Ontological engineering, categories, objects, actions, situations, Situation Calculus, semantic networks, description logics, reasoning with default systems
8. Planning: Planning with state space search, Partial-Order Planning, Planning Graphs, Planning with Propositional Logic, hierarchical task network planning, non-deterministic domains, conditional planning, continuous planning, multi-agent planning
9. Miscellaneous Topics: Fuzzy logic systems, Natural Language Processing

Reference Books
Course Title: B. Tech. Project
Department: Computer Science and Engineering
Offered for: 4th to 8th Semester
Pre-requisite:

Course No.: CS399
L-T-P [C]: 0-0-9 [3]
Type: Compulsory
To take effect from: July 2014

Objectives
1. To gain hands on experience on innovative technology project
2. To prepare the students to solve/work on the real world/practical/theoretical problems involving issues in computer science and engineering

Learning Outcomes
1. Ability to design and model a system
2. Ability to plan and execute well defined objective
3. Ability to work in team at component level and system level
4. Ability to troubleshoot
5. Ability to reuse- or integrate with- existing components
6. Ability to derive performance metrics and assess quantitatively the performance of system
7. Ability to report and present the findings in standard formats
VII Semester

Course Title  B. Tech. Project  Course No.  CS498
Department  Computer Science and Engineering  L-T-P [C]  0-0-23 [7]
Offered for  4th to 8th Semester  Type  Compulsory
Pre-requisite  To take effect from  July 2014

Objectives
1. To gain hands on experience on innovative technology project
2. To prepare the students to solve/work on the real world/practical/theoretical problems involving issues in computer science and engineering

Learning Outcomes
1. Ability to design and model a system
2. Ability to plan and execute well defined objective
3. Ability to work in team at component level and system level
4. Ability to troubleshoot
5. Ability to reuse or integrate with existing components
6. Ability to derive performance metrics and assess quantitatively the performance of system
7. Ability to report and present the findings in standard formats
VIII Semester

Course Title: B. Tech. Project
Department: Computer Science and Engineering
Offered for: 4th to 8th Semester

Course No.: CS499
L-T-P [C]: 0-0-24 [8]
Type: Compulsory
To take effect from: July 2014

Objectives
1. To gain hands on experience on innovative technology project
2. To prepare the students to solve/work on the real world/practical/theoretical problems involving issues in computer science and engineering

Learning Outcomes
1. Ability to design and model a system
2. Ability to plan and execute well defined objective
3. Ability to work in team at component level and system level
4. Ability to troubleshoot
5. Ability to reuse-or integrate with-existing components
6. Ability to derive performance metrics and assess quantitatively the performance of system
7. Ability to report and present the findings in standard formats

#### Objectives
1. To understand the algorithms for Routing, Forwarding, Lookup, Resource management in packet switching networks
2. To understand different quality of service and transport frameworks
3. To understand the Internet architecture and router internals
4. To understand the limitations of current Internet architecture
5. To introduce the new networking architectures

#### Learning Outcomes
1. Ability to identify the essential components of networking
2. Ability to analyze the algorithms for routing, forwarding, lookup with respect to stability, robustness, scalability, security
3. Ability to analyze the performance of congestion control and resource management techniques
4. Ability to carry out further research in recent networking architectures

#### Contents
1. Introduction to Packet Switching, Networking and Network Routing
2. Network Routing Algorithms: Routing in IP Networks, Internet Routing Architecture, Intra-and Inter- Domain Routing, BGP Internals, Approaches to achieve reliable, scalable, and secure routing
3. IP Multicasting: Group Management and Membership, Multicast Routing Protocols
4. Router Internals: Functions of a Router, Elements of a router, packet flow, packet processing fast and slow paths, data and control planes, Router architectures
5. IP Address Lookup Algorithms: Longest prefix matching, Binary and Multibit tries, Compressing multibit tries, Hardware algorithms
6. Resource Management: Queuing disciplines, Active Queue Management techniques, Scheduling algorithms, Congestion control mechanisms, Congestion avoidance mechanisms
7. Internet Service models: Quality of Services (InterServ, DiffServ RSVP), Multiprotocol Label Switching, VoIP
8. Recent networking architectures: Software defined networks, Data center networks, Content delivery networks, Peer-to-peer networks

#### Laboratory
1. Analysis of protocol headers and journey of a packet through wireshark
2. Implementation of ARP queries and responder, IP packet forwarder, AQM RED router
3. Performance analysis of scheduling algorithms (WFQ, DRR, RR), traffic shaping algorithms, congestion control techniques
4. Working with intra-domain and inter-domain routing protocols
Reference Books
4. Research papers from Conferences/Journals (ex. IMC, ANCS, NSDI, SIGCOMM, CoNext, ToN, JSAC)
Course Title: Pattern Recognition  
Course No.: CS652  
Department: Computer Science and Engineering  
Offered for: M. Tech. / B. Tech final year  
Type: Elective  
Pre-requisite: Consent of Teacher  
To take effect from: July 2014

Objectives
1. To familiarize with the mathematical and statistical techniques used in pattern recognition.
2. To understand and differentiate among various pattern recognition techniques.

Learning Outcomes
1. Ability to formulate high dimensional feature vectors from observations.
2. Ability to select an appropriate pattern analysis tool for analysing data in a given feature space.
3. Ability to apply pattern analysis tools to practical applications and detect patterns in the data.

Contents
1. Introduction: Definitions, data sets for Pattern Recognition, Different Paradigms of Pattern Recognition
2. Bayes Decision Theory: Bayes decision rule, Minimum error rate classification, Normal density and discriminant functions, Bayesian networks
3. Generative Methods: Maximum Likelihood and Bayesian Parameter Estimation, Non-parametric techniques
4. Discriminative Methods: Distance-based methods, Linear Discriminant Functions, Artificial Neural Networks, Support Vector Machines
5. Clustering: k-means clustering, Gaussian Mixture Modeling, EM-algorithm
6. Principal Component Analysis: PCA, Kernel PCA, Probabilistic PCA
7. Combining Classifiers: Bagging and Boosting, Adaboost, Bayesian Model Averaging

Reference Books
Course Title: Digital Image Analysis  
Course No.: CS654  
Department: Computer Science and Engineering  
Offered for: M. Tech. / B. Tech final year  
Type: Elective  
Pre-requisite: Consent of Teacher  
To take effect from: July 2014

Objectives
1. To introduce the origin and formation of digital imaging.
2. To develop the understanding of different types of imaging techniques for different purposes.
3. To equip the students with various possible applications of the image analysis.

Learning Outcomes
1. Ability to enhance image in spatial and frequency domain.
2. Ability to implement various aspects of image segmentation and compression.

Contents
3. Images Enhancement: Point processing, enhancement in spatial domain, enhancement in frequency domain.
4. Detection of edges and lines in 2D images: First order and second order edge operators, multi-scale edge detection, Canny's edge detection algorithm, Hough transform for detecting lines and curves.
7. Segmentation: Segmentation of grey level images, Watershed algorithm for segmenting grey level image.
8. Morphology: Dilation, erosion, opening, closing, hit and miss transform, thinning, extension to grey scale morphology.

Reference Books
**Course Title**  Computational Complexity Theory  
**Course No.**  CS655  
**Department**  Computer Science and Engineering  
**Offered for**  M. Tech. / B. Tech final year  
**Type**  Elective  
**Pre-requisite**  Consent of Teacher  
To take effect from July 2014

**Objectives**
1. To learn about different complexity classes and how they are related to each other
2. To learn about reducing one problem to another problem

**Learning Outcomes**
1. To be able to identify the problems according to their complexity classes

**Contents**
1. *Turing Machines and Diagonalization:* Turing Machine, Universal Turing Machine, Uncomputability Deterministic Time Hierarchy Theorem, Nondeterministic Time Hierarchy Theorem, Ladner's Theorem, Oracle Machines
2. *Time Complexity Classes:* P, NP, coNP, EXP, and NEXP Time complexity classes, P, NP, coNP, EXP, and NEXP
3. Reducibility and NP-Completeness, Cook-Levin Theorem, Some examples of NP-Complete Problems
4. *Space Complexity Classes:* PSPACE, and NL Space Complexity Classes PSPACE, and NL PSPACE Completeness, NL Completeness
5. *The Polynomial Hierarchy and Alternating Turing Machines:* Polynomial Hierarchy, Alternating Turing Machines, Polynomial Hierarchy using Oracle Machines
8. *Interactive Proofs:* IP = PSPACE, Interactive Proofs, Public Coins and AM, IP = PSPACE
9. *Applications to cryptography:* Computational Security, One-Way Functions, and Pseudorandom Generators, Zero Knowledge
10. *Quantum Complexity Classes:* BQP, Definition of Quantum Computation and BQP, Quantum Algorithms, BQP and Classical Complexity Classes
11. *Hardness of Approximation:* Applications of PCP Theorem: PCP Theorem, Hardness of Approximation for Vertex Cover and Independent Set

**Reference Books**
Course Title: Machine Learning
Department: Computer Science and Engineering
Course No.: CS656
Offered for: M. Tech. / B. Tech final year
Type: Elective
Pre-requisite: Consent of Teacher
To take effect from: July 2014

Objectives
1. To develop a broad perspective about the applicability of ML algorithms in different fields.
2. To understand the major ML algorithms, the problem settings, and assumptions that underlies them.

Learning Outcomes
The student will be able to:
1. Identify the machine learning algorithms which are more appropriate for various types of learning tasks in various domains
2. Implement machine learning algorithms on real datasets

Contents
1. Introduction: Well-posed learning problems, Designing a Learning System, Perspectives and Issues in Machine learning
2. Concept Learning and General-to-specific Ordering: A concept learning task, Concept learning as Search, Finding a maximally specific hypothesis, Version Spaces and Candidate elimination algorithm, Inductive Bias
3. Decision Tree Learning: Decision tree learning algorithm, Hypothesis space search in decision tree
4. Evaluating Hypothesis: Estimating Hypothesis accuracy, Basics of sampling theory, Deriving confidence intervals, Hypothesis testing, comparing learning algorithms
5. Bayesian Learning: Bayes theorem and concept learning, Maximum likelihood and least square error hypotheses, Minimum description length principle, Bayes optimal classifier, Gibbs algorithm, Naive Bayes classifier
6. Computational Learning Theory: Probably learning an approximately correct hypothesis, PAC learnability, The VC dimension, the mistake bound model for learning
7. Linear Models for Regression: Linear basis function models, The Bias-Variance decomposition, Bayesian Linear Regression, Bayesian Model comparison
8. Kernel Methods: Constructing kernels, Radial basis function networks, Gaussian Processes
11. Reinforcement Learning: The learning task, Q learning, Non-deterministic rewards and action, Temporal difference learning, Generalizing from examples

Reference Books
